THE CATEGORY WE ARE BUILDING

Digital Asset Intelligence & Protection

An identity, evidence and control layer around the digital work that matters most to a person, a studio or an organisation.

WHERE WE ARE GOING

Never lose what matters

A world where important digital assets and career journeys are never without identity, memory, evidence or control.

IN BRIEF · A TWO-MINUTE READ

Everything that follows, on one page.

PinitHub is a digital technology company building infrastructure for important digital work. We give digital assets **identity, memory, protection and control** — so that what matters is never separated from its owner, its evidence, or the ability to act on it.

THE PROBLEM

Digital creation has scaled. Digital control has not. An owner's understanding of their own work usually stops shortly after they share it — everything downstream happens in places the original system cannot see.

WHAT WE DO ABOUT IT

We treat an important file not as a static object but as an evolving digital asset, carrying its origin, history, relationships, permissions and evidence with it. Storage answers "where is the file?" — we are built to answer "what happened to this asset?"

AT A GLANCE

MOTTO

Secure · Connect · Control

THE MODEL

THREE PLATFORMS, ONE CONNECTING IDEA

Pinit HUB

LIVE

Protect and understand important digital assets. Protect → prove → share → track → monitor → investigate.

Pinit Exchange

LIVE

Bring protected creative work into controlled commerce. Discover → view → license → purchase → deliver.

Pinit Career

VISION

Connect learning, evidence and opportunity. Learn → build → prove → intern → prepare → get hired.

WHERE WE ARE GOING

Toward deeper relationships between identity, assets, evidence, rights, activity and opportunity — extending the same model from digital assets to the evidence of a career.

Reading this document: sections 01–05 are the company and its thinking; 06–08 the problem; 09–11 how the platform works; 12–16 the products, with live product screens; 17–23 how we work and where we are going. Each section stands on its own — start wherever your question is.

PART ONE

The Company

Who PinitHub is, what a PinitHub asset means, and the vision, mission and belief the whole platform is built on.

01

WHO WE ARE

A new infrastructure for the digital assets that matter.

People create digital work. Businesses operate through digital content. Brands depend on digital assets. Agencies manage thousands of files for clients. AI is generating entirely new volumes of material.

Yet the infrastructure around those assets remains fragmented. Files are stored in one place. Identity exists somewhere else. Ownership may exist in a contract. Activity is recorded by another platform. Usage happens somewhere else again. And evidence is usually collected only after a problem has already occurred.

PinitHub is being built to connect those pieces. Instead of treating a digital asset as a static file, we treat it as an evolving digital object with identity, memory, relationships, evidence and control.

THE FRAGMENTATION

Files stored in one place

Identity somewhere else

Ownership in a contract

Activity on another platform

Usage somewhere else again

Evidence only after a problem

PLATFORM 01

Pinit HUB

LIVE

Digital asset intelligence and protection. Protect important work, give it a durable identity, share it under control and understand what happened to it.

PLATFORM 02

Pinit Exchange

LIVE

Creative commerce and licensing. Bring Hub-protected creative work to market with clear terms and controlled delivery.

PLATFORM 03

Pinit Career

VISION

A career operating system connecting learning, projects, internships and evidence to real opportunity.

02

WHAT IS A PINITHUB ASSET?

More than a file.

A TRADITIONAL SYSTEM SEES

Filename + Size + Location

Enough to find it. Not enough to understand it, prove it or act on it.

PINITHUB SEES

Identity + Origin + Ownership + Content + Relationships + Activity + Rights + Evidence + History + Status

That difference is fundamental.

THE PINITHUB ASSET MODEL — TWELVE ELEMENTS

01 Identity A persistent identity built from multiple signals, not one identifier.	02 Creator Who created or originated the asset.	03 Ownership Who owns, controls or holds authorised rights.	04 Metadata File, date, content, technical and contextual information.
05 Versions Original, revision, derivative and published version — as relationships.	06 Relationships People, organisations, projects, campaigns, clients, platforms, licences.	07 Activity Upload, access, share, download, publication, revocation.	08 Permissions Who may view, download, share, modify, manage or revoke.
09 Provenance Where it came from, and what supports that origin.	10 Evidence Ownership records, licences, publication and investigation records.	11 History Asset memory — the timeline of what happened over time.	12 Status Draft, active, shared, protected, published, under investigation, revoked, archived.

TRADITIONAL FILE

IMG_4837.jpg

→

PINITHUB ASSET

Creator connected · Owner connected · Asset DNA generated · Origin recorded · Versions connected · Relationships connected · Activity recorded · Rights connected · Evidence available · Status active

OUR VISION

A world where important digital assets and career journeys are never without identity, memory, evidence or control.

FOR DIGITAL ASSETS

An asset carries who made it, where it came from, what has happened to it, who may use it, and what can be proven about it.

FOR PEOPLE

A career is a sequence of real work. When each step leaves verifiable evidence, opportunity stops depending on self-description.

Our long-term ambition is a persistent intelligence layer around digital assets — allowing people and organisations to understand where their assets came from, how they relate to other assets and entities, what happens to them over time, and what control they retain.

OUR MISSION

Turn disconnected digital activity into connected, evidence-backed journeys.

To give people and organisations the intelligence and control they need to protect, understand and manage the digital assets that matter to them.

ONE CONNECTED ENVIRONMENT — WITHOUT LOSING CONTEXT

WHAT THAT MEANS IN PRACTICE

- Give an important asset an identity that survives copying and renaming
- Keep custody, permissions and activity in one place rather than four
- Make provenance and ownership something that can be produced as evidence
- Let sharing happen without surrendering all visibility and control
- Connect commerce to protected work instead of treating them as separate acts
- Let a career record be assembled from verifiable work rather than assertions

OUR DISCIPLINE

We build for the parts of the journey we can genuinely support, and we are explicit about scope. Monitoring covers enrolled assets and surfaces we are authorised to observe. A discovered lookalike is a signal to investigate, never proof on its own.

That discipline is the product. Evidence that overstates itself is not evidence.

OUR CORE BELIEF

A digital asset should have a memory.

Most digital systems remember where a file is. Very few are designed to remember where it came from, who created it, who owns it, which version is original, who received it, where it was shared or published, what it relates to, how it has changed, what evidence exists, what rights apply, and what has already been done about it.

The asset should carry its context with it.

NOT EMBEDDED IN EVERY COPY - REPRESENTED THROUGH A PERSISTENT INTELLIGENCE LAYER

THE FUNDAMENTAL SHIFT

Files	→	Assets
Storage	→	Asset Memory
Links	→	Persistent Relationships
Monitoring	→	Asset Intelligence
Evidence after a problem	→	Evidence throughout the lifecycle
Access	→	Control

NEVER LOSE WHAT MATTERS.

Not merely because the file is stored — but because its identity, memory, relationships, evidence, protection, intelligence and control can remain connected to it.

PART TWO

The Problem

Digital creation has scaled. Digital control has not. What that gap looks like in practice, and why it is widening now.

THE PROBLEM WE SEE

Digital creation has scaled.

Digital control has not.

06

THE JOURNEY OF AN IMPORTANT DIGITAL ASSET

CREATE → STORE → **SHARE** → PUBLISH → COPY → MODIFY → RE-UPLOAD → REDISTRIBUTE

THE CONTROL GAP

The asset keeps moving. But the owner's understanding of its journey frequently stops shortly after **Share**. Everything downstream happens in places the original system cannot see.

Storage can tell you "*your file is here.*" Modern organisations need to know "**what happened to my asset?**" — a fundamentally different question.

TEN PROBLEMS THIS CREATES

01

Fragmentation

Assets spread across devices, drives, email, agency and client systems, CMS, social and marketplaces.

02

Ownership uncertainty

The file exists; the record of who owns it, commissioned it or licensed it often does not.

03

Version confusion

Six files named "final" — the problem is not the count, it is not knowing their relationship.

04

Unauthorised usage

Work legitimately shared once, then used beyond its intended purpose.

05

Asset leakage

Download, forward, copy, capture, external upload — visibility is often lost before it is missed.

06

Platform fragmentation

Each platform sees only part of the journey. No one sees the whole of it.

07

Missing provenance

An asset circulates far beyond its original context, and "where did this come from?" gets hard.

08

Missing evidence

Evidence assembled after the fact — screenshots, searched email, reconstructed dates — is fragile.

09

Manual investigation

Reverse searches, spreadsheets and manual comparison turn one question into a project.

10

AI-generated content

Telling original from derived, modified, synthetic or reused becomes steadily more important.

These are structural gaps, not failures of any one tool. Storage protects a location. Security protects access. Monitoring identifies activity. Provenance establishes origin. DAM organises. Copyright tools search. Each solves a real part well — what is missing is the layer that connects them around the asset itself.

THE ASSET JOURNEY

Sixty days in the life of one creative asset.

Day 01	A creator produces an original design.
Day 03	The design is shared with an agency.
Day 07	The agency sends it to a client.
Day 15	The client publishes it on a website.
Day 21	Someone downloads it.
Day 30	A modified version appears elsewhere.
Day 45	The design appears on another website.
Day 60	The original creator discovers the use.

AND THEN THE QUESTIONS BEGIN

- Where was the original?
- Who received it?
- Which version was used?
- When did it appear?
- Was the new version derived from the original?
- Who published it?
- What evidence supports the relationship?
- What rights existed?
- What action can the owner take?
- Can we reconstruct what happened at all?

Today, answering these questions usually means pulling together several disconnected systems and a great deal of manual work — often months after the moment that mattered. PinitHub is built around exactly this problem: making the journey legible while it is still happening, rather than reconstructing it afterwards.

While it happens Activity and relationships are recorded as part of the asset's life, not gathered in an emergency.	Structured, not ad hoc Discover, compare, verify, document and act — a workflow rather than a scramble.	Owner-controlled What happens next is the owner's decision, supported by evidence they can produce.
---	---	---

WHY THIS MATTERS NOW

The gap is widening.

The distance between how much digital content we create and how much control we have over it is growing — and seven forces are widening it at once.

FORCE 01

Creator economy

More individuals are turning creative work into businesses, where the asset *is* the revenue.

FORCE 02

Artificial intelligence

Content can be generated, transformed and reproduced at unprecedented speed and volume.

FORCE 03

Platform fragmentation

Assets move across an increasing number of platforms, each seeing only its own slice.

FORCE 04

Distributed work

Teams, agencies, clients and contractors work across organisational boundaries by default.

FORCE 05

Digital rights

Ownership, licensing and usage rights are becoming materially more complex.

FORCE 06

Enterprise governance

Businesses need demonstrable visibility over important digital information.

FORCE 07

Content volume

The sheer number of assets an organisation must manage is rising faster than the tools built to manage them.

OUR RESPONSE

The answer is not simply *store more*. It is **understand more, remember more, protect more, connect more, control more** — which is why everything we build begins with the asset.

PART THREE

The Platform

The category we are building, the five layers it rests on, and the lifecycle an asset moves through — from creation to control.

A NEW CATEGORY

Digital Asset Intelligence & Protection

PinitHub begins with a simple premise: the digital asset itself should become the centre of the system. Not the folder. Not the drive. Not the link. Not the platform. **The asset.**

Not another cloud drive

Storage answers "where can I store this?" We ask what the asset is, what has happened to it, and what control remains.

Not another DAM

Asset management organises and distributes. We extend toward identity, history, relationships, evidence and control.

Not a copyright monitor

Monitoring asks where content appears. We ask whether it is related, what its history is, and what should follow.

Not a provenance system alone

Origin is one part of a lifecycle. We connect provenance to activity, evidence, protection and control.

Each of those categories solves an important part of the problem well. PinitHub is designed to connect those capabilities around the asset rather than compete with any one of them.

THE PINITHUB MODEL

IDENTITY	Who or what is this?
MEMORY	What has happened to it?
RELATIONSHIPS	What and who is it connected to?
INTELLIGENCE	What can we understand from those relationships?
PROTECTION	How can it be protected?
EVIDENCE	What can substantiate its history and rights?
CONTROL	What can the owner or organisation actually do?

WHAT PINITHUB IS BUILDING

Five fundamental layers.

LAYER 01

Identity

Give assets a persistent digital identity — one built from multiple signals rather than a filename, and that survives copying, renaming and re-encoding.

LAYER 02

Memory

Build a history of asset activity, versions, relationships and lifecycle events, so the record of what happened exists before anyone needs it.

LAYER 03

Intelligence

Use analysis, search and relationship intelligence to understand what is happening around an asset — turning isolated signals into something meaningful.

LAYER 04

Protection

Protect assets through secure custody, controlled sharing, permissions, monitoring and response mechanisms that the owner governs.

LAYER 05

Control

Give owners and organisations the ability to understand, manage and act on their assets — because intelligence that cannot lead to action is only observation.

IDENTITY + MEMORY + INTELLIGENCE + PROTECTION + CONTROL

Together, these five layers are the foundation of PinitHub.

THE PINITHUB ASSET LIFECYCLE

From creation to control.

Capture & upload

An asset enters through a trusted entry point, or is brought in from where it already lives.

Identify & analyse

Associated with a user, organisation, time and source, then analysed to understand what it contains.

Asset DNA

A richer technical representation combining cryptographic, perceptual, semantic and contextual signals.

Verify & protect

The asset moves through verification states, then receives permissions, custody and controlled links.

Share & track

Sharing creates a relationship — creator to agency, agency to client — and that becomes part of its history.

Monitor & discover

Enrolled assets are watched across authorised surfaces for appearances, similarity and new relationships.

Discovery is not the same as proof

A finding progresses from **potential match** to **likely relationship** to **verified relationship**, and only as far as the available evidence genuinely supports. This distinction is critical to trust — we treat it as a product requirement, not a caveat.

Evidence

The original asset, its DNA, creator, ownership information, timestamp, source, the discovery and the relationship are organised into a structured evidence package.

Control

Continue monitoring · change permissions · revoke access · preserve evidence · contact a party · update rights · archive · escalate for investigation.

Not every asset journey ends with a problem. An asset may stay active, be published, licensed, reused, archived, reactivated and protected again — so the lifecycle is treated as continuous, not linear.

PART FOUR

The Products

Three platforms — Pinit HUB, Pinit Exchange and Pinit Career — and the capabilities behind them.

WHAT WE BUILD

Three platforms.

Distinct purposes, one philosophy.

Pinit HUB

LIVE

Protect and understand important digital assets.

PROTECT → PROVE → SHARE → TRACK → MONITOR → INVESTIGATE

For creators, studios, agencies and organisations whose work carries commercial, legal or reputational weight.

Pinit Exchange

LIVE

Bring protected creative work into controlled commerce.

DISCOVER → VIEW → LICENSE → PURCHASE → DELIVER

For creators bringing work to market, and buyers who need clarity about what they are licensing and from whom.

Pinit Career

PLATFORM VISION

Connect learning, evidence and opportunity.

LEARN → BUILD → PROVE → INTERN → PREPARE → GET HIRED

For learners, institutions and recruiters who need a career record made of verifiable work rather than claims.

The three are deliberately separate products with separate audiences. They share one philosophy — **identity, evidence and control** — and one account identity, so work protected in Hub is the same work licensed on Exchange and, in time, the same work that evidences a career.

OUR TECHNOLOGY & CAPABILITIES

Capabilities, not components.

What follows is what the platform does for the people who use it. The engineering beneath it is deliberately not the subject of this document.

Digital Identity

Persistent identity for the people using the platform and for the assets they protect.

Asset DNA & Provenance

A multi-signal identity for an asset, connected to evidence of its origin and history.

Secure Protection

Encrypted custody of the original, with access governed by the owner.

Controlled Sharing

Permission-based links with access control, expiry, revocation and a record of activity.

Verification

Ownership certificates and provenance evidence that a third party can check.

Monitoring

Observation of enrolled assets across configured and authorised surfaces.

Intelligence

Similarity, activity, risk and evidence analysis supporting investigation and decisions.

Marketplace Infrastructure

Listings, licence terms, purchasing and controlled delivery for protected work.

AI & Automation

Content analysis, extraction and automated checks that reduce manual review in these workflows.

Career Intelligence

PLATFORM VISION

Evidence-backed learning, assessment, project, internship and opportunity records — extending the same identity and evidence model from assets to careers.

HOW WE DESCRIBE OUR OWN CAPABILITY

We state scope plainly. Monitoring applies to assets that have been enrolled, on surfaces we are authorised to observe. Activity records cover the sharing and access paths the platform itself provides. A discovered lookalike is a lead for investigation until evidence establishes otherwise. We would rather describe a smaller capability accurately than a larger one loosely.

PRODUCT — PINIT HUB LIVE

Digital Asset Intelligence & Protection

THE PROBLEM

Important digital work needs identity, evidence and control across its whole life — not only while it sits in a folder. The moment it is shared, published or handed to a client, the systems that held it stop being able to answer questions about it.

THE SOLUTION

Pinit HUB is a protected environment where important assets can be protected, identified, shared, tracked, monitored and investigated — with the owner's control intact at each step.

THE HUB JOURNEY

PROTECT → PROVE → SHARE → TRACK → MONITOR → INVESTIGATE

CAPABILITIES

- **Protect** — bring an asset into secure custody
- **Asset identity & DNA** — identity beyond a filename
- **My Assets** — every protected file in one library
- **Permissions** — who may reach an asset, and how
- **Activity** — what happened to it, and when
- **Certificates** — verifiable ownership records
- **Controlled sharing** — access rules, expiry, revocation
- **Needs attention** — suspicious access and expiring shares, surfaced
- **Monitoring** — enrolled assets, authorised surfaces
- **Investigate a file** — compare, verify, document
- **Reports** — evidence packaged for someone else to read
- **Business collaboration** — clients, campaigns, versions, handover

BUSINESS VALUE

- Strengthen the evidence behind asset ownership
- Keep context attached to important files
- Share work without losing visibility of it
- Understand the activity around an asset
- Build a stronger evidence trail over time
- Support agencies managing client work at volume

PINIT HUB — THE PRODUCT

Access begins with identity.

PINIT HUB — SECURE ACCESS

LIVE PRODUCT SCREEN

Everything in Hub is anchored to a verified account identity. Assets, certificates, shares, activity records and campaign work all resolve back to a person or an organisation — which is what makes ownership evidence meaningful rather than merely asserted.

Protect

An asset enters secure custody and receives an identity independent of its filename.

Share under control

Access is granted deliberately — with rules, an expiry and the ability to revoke.

Investigate

When something surfaces elsewhere, compare it, verify the relationship and document findings.

WHAT MAKES HUB DIFFERENT

A storage product answers "where is the file?". Hub is built to answer "**what happened to this asset?**" — for the assets an owner has chosen to enrol, across the surfaces we are authorised to observe.

PINIT HUB — THE PRODUCT

Every file, with its whole record.

PINIT HUB — MY ASSETS

LIVE PRODUCT SCREEN

Every protected file sits in one library, and opening one opens its record rather than just a preview. The panel is where the asset model stops being a diagram: protection status, the people who may reach it, and everything that has happened to it, on the asset itself.

Overview · Details

What the asset is, when it entered custody, and the protection standing against it.

Permissions

Who may reach the asset and on what terms — the control layer, per file.

Activity

What has happened to it, in order. This is the asset's memory.

ACCESS

An asset's access state is stated plainly on the record — **only you control** until its owner decides otherwise. Sharing is something the owner grants, not something that happens to the file.

PINIT HUB — THE PRODUCT

What needs your attention.

PINIT HUB — HOME

LIVE PRODUCT SCREEN

Intelligence that cannot lead to action is only observation, so Hub opens on the things that may need a decision — suspicious access, shares about to expire, security events, monitoring matches — rather than on a folder tree.

Needs attention

The events worth a decision, surfaced before they are discovered by accident.

Asset overview

What is protected, what is being shared, and what is being watched.

Exchange selling

What is listed for licence, reported back into Hub — the protection stays where the asset lives.

Creative Marketplace

THE PROBLEM

Creators need a way to bring protected creative work to market. Buyers need to know what they are licensing, who made it and what they may do with it — before they commit.

THE SOLUTION

Pinit Exchange connects creators and buyers around Hub-protected creative assets, with licence terms stated up front and delivery that stays under control.

THE EXCHANGE JOURNEY

FOR CREATORS

- List protected creative work
- Define licence terms
- Manage listings
- Manage sales and earnings

FOR BUYERS

- Discover creative work and creators
- View asset detail and provenance
- Select a licence
- Purchase and receive controlled delivery

THE TRUST MODEL

Hub protects

Asset identity, custody and the evidence behind ownership.

Exchange transacts

Listings, cart, orders, licensing and delivery.

Anything protected in Pinit HUB can be listed and licensed on Exchange. The certificate, the protection and the full history stay in HUB — commerce is optional, identity-linked, and never the thing that holds the asset.

PINIT EXCHANGE – THE PRODUCT

Every listing begins as protected work.

PINIT EXCHANGE – SELLER OVERVIEW

LIVE PRODUCT SCREEN

PINIT EXCHANGE – DISCOVER

LIVE PRODUCT SCREEN

Discover

Browse by type, price, licence and creator.

Understand

See the work, its creator and the licence on offer.

License

Purchase with terms attached and delivery controlled.

Career Operating System

THE PROBLEM

Learning, projects, internships and employment evidence are scattered across platforms that do not connect. A learner ends up describing their capability; a recruiter ends up trusting the description.

THE INTENT

Connect the journey from learning to opportunity through evidence that carries forward — applying the same identity and evidence model PinitHub already applies to digital assets.

Students

Build a record made of real work, not claims.

Colleges

Connect training, projects and placement in one view.

Recruiters

Assess candidates on evidence that can be checked.

Organisations

Run internships that leave a verifiable trail.

Where Career stands today

Pinit Career is the third platform in the PinitHub ecosystem and is presented here as product direction. The model above describes what we are building toward and how it connects to the identity and evidence work already running in Pinit HUB. Product screens will be shared as the platform is released.

PART FIVE

The Company at Work

Who we serve, how we deliver, what distinguishes us, and where the platform is going next.

WHO WE SERVE

Built for people whose work carries weight.

Creators & creative professionals

Protect, prove and license creative work — and keep a record of where it has been.

Businesses & enterprises

Protect important digital assets and maintain the evidence and control that governance requires.

Recruiters

Evaluate candidates on career records that can be verified rather than only described.

Agencies & studios

Manage client assets, campaigns, versions, approvals, rights and handover in one place.

Education & institutions

Connect learning, projects, internships and placement into a single evidence-backed record.

Individuals

Protect personal and professional work that would be difficult or impossible to reproduce.

A NOTE ON SCOPE

PinitHub is built as general infrastructure for digital assets, and it applies wherever important digital work needs identity, evidence and control. We describe the segments above because they are where the platform is designed and used today. We do not present specialised regulated-industry deployments we have not built.

HOW WE WORK

A delivery method built around the asset lifecycle.

01	Discover	Understand the business problem, the asset lifecycle behind it, and what the organisation actually needs to be able to prove or control.
02	Design	Design the product experience, the workflows and — most importantly — the control model: who may do what, to which asset, under which conditions.
03	Build	Engineer the platform capabilities the solution requires, on the shared identity, protection and evidence foundations.
04	Integrate	Connect the systems, identities, APIs and workflows already in place so the platform joins the organisation's work rather than sitting beside it.
05	Deploy	Release into the appropriate environment with the security and operational controls that environment demands.
06	Support & evolve	Measure how the platform is used, improve it, and extend it as the organisation's asset lifecycle changes.

The sequence matters less than the principle behind it: protection and control are designed into the workflow at the start, not added once something has already gone wrong.

WHY PINITHUB

What we do differently.

01

Identity first

Important work is connected to a persistent identity — for the asset and for its owner — before anything else happens to it.

02

Evidence over claims

Provenance and activity should be supported by records that can be produced and checked, not by assertion.

03

Protection, then commerce

Work is protected first. Licensing and delivery are an option that follows — never a precondition.

04

Controlled sharing

Sharing should not mean giving up all visibility. Access can be scoped, expired and withdrawn.

05

Connected lifecycle

Create, protect, collaborate, license, deliver, track and verify — one continuous journey rather than seven disconnected tools.

06

Security & privacy by design

Protection and control are part of the workflow itself rather than a layer applied afterwards.

ONE ECOSYSTEM

PINIT HUB

PINIT EXCHANGE

PINIT CAREER

Three platforms addressing different parts of the digital journey, held together by one company vision and one identity. Protect in Hub. License on Exchange. Evidence a career with the same work.

Secure · Connect · Control

NEVER LOSE WHAT MATTERS

COMPANY VALUES

What we hold to.

A company that asks people to trust it with the work that matters most to them is making a promise about its own conduct as much as its technology. These are the commitments the platform is built to keep.

Trust

Technology should strengthen confidence between people, organisations, systems and the assets that pass between them.

Ownership

People and organisations should have clarity about what they create, manage and control.

Security

Protection belongs in the architecture, not bolted on after something has gone wrong.

Transparency

Important digital activity should be understandable and accountable to the person it belongs to.

Intelligence

Technology should turn complexity into useful understanding rather than more of it.

Innovation

We keep looking for approaches to problems existing systems do not adequately address.

Responsibility

What we build has to account for security, privacy, accountability and responsible use.

Simplicity

Complex technology should produce simple experiences. The difficulty belongs to us, not the user.

Persistence

Digital value should not disappear simply because it moved between systems or platforms.

Human-centred technology

Technology should ultimately empower the people using it rather than overwhelm them.

FUTURE DIRECTION

Where PinitHub is going.

The platform extends in two directions at once — deeper into the life of a digital asset, and outward into the life of a career.

DIGITAL ASSETS

CAREER

PinitHub is evolving toward deeper relationships between identity, assets, evidence, rights, activity, intelligence and opportunity. The areas below describe that direction.

Deeper asset relationship intelligence

Understanding how assets, versions and derivatives relate to one another over time.

Broader authorised-surface monitoring

Extending coverage across the surfaces we are permitted to observe.

Continuous evidence

Evidence assembled throughout the lifecycle rather than gathered when something goes wrong.

Richer career evidence

Turning verified work into a career record that travels with the person.

Institution & recruiter workflows

Connecting colleges, internship programmes and hiring pipelines to that evidence.

The closed loop

Connect, understand, learn and protect again — the destination the lifecycle points toward.

This page describes direction, not delivered capability. Where a capability is available today it is described with the products in sections 14 and 15; where it is ahead of us, it appears here.

OUR TEAM & LEADERSHIP

The people behind the platform.

PinitHub is built by a product and engineering team working across platform infrastructure, asset intelligence, marketplace systems and design.

HOW WE ARE ORGANISED

- **Platform engineering** — identity, protection, custody and evidence
- **Asset intelligence** — analysis, similarity, monitoring and investigation
- **Marketplace** — listings, licensing, orders and delivery
- **Product & design** — experience, workflows and the control model

COMPANY

TheCareerTech Pvt. Ltd.

Bangalore, India

PINITHUB is the company and platform brand under which Pinit HUB, Pinit Exchange and Pinit Career are delivered.

The digital world is built on assets.

Losing control of those assets can mean losing control of what matters most.

PinitHub gives digital assets identity, memory, protection and control — from creation to use, sharing, licensing and beyond.

PINITHUB

SECURE • CONNECT • CONTROL

CONTACT & PARTNERSHIP

Build with PinitHub.

We work with creators, agencies, businesses and institutions who need their digital work to carry identity, evidence and control.

Whether it is a single body of creative work or the digital assets of an entire organisation, the conversation starts the same way — what do you need to be able to prove, and what do you need to stay in control of? Tell us that, and we will show you what the platform does about it.

FOR CLIENTS

See the platform on your own assets, with your own workflow.

FOR PARTNERS

Integrate, resell or build on the PinitHub platform.

FOR INSTITUTIONS

Connect learning, internships and placement evidence.
